ABSTRACT

Metastorm's Provision business modelling tool provides four main uses: building an Enterprise Architecture, creating an environment for ongoing Process Improvement, creating a Repository and a Requirements Analysis framework. This framework will ensure application development from strategy to process to technical specifications can be traced and managed.

Converting business process models for deployment in process execution environments is often the ultimate gain as it is potentially very valuable. This typically requires a significant amount of work and creates potential for error.

This presentation reviews this topic and presents an approach to overcome some of these obstacles.
